

Electric Lawn Tractor - Smart Features

Last Updated Saturday, 01 December 2007

Patent pending design

The tractor direction and speeds are controlled by a foot pedal for forward and a separate pedal for reverse or optional hand control

PTO: Since the power take off is a low voltage heavy duty electrical outlet, all attachments including the cutter deck just plug into the tractor's PTO outlet. There are no belts, pulleys, springs, levers, etc. Should you wish to remove an attachment, eg. mower deck, snowblower, etc., all you do is unplug it, then remove it from the tractor. No belts, pulleys, springs to bother with or wear out! Refueling: No more trips to the gas station! Gas storage, gas spills, checking oil, oil changes, spark plugs or starting worries! Refueling is as simple as plugging a cord into the tractor's charging receptacle. The rest is done automatically by the Smart Charger! It even shuts off when the batteries are fully charged, so they can never be overcharged. Once the charging plug is connected to the tractor, the tractor is disabled, and nothing can be operated until the plug is removed.
